

PERSONAL HEALTH OPERATING SYSTEM

Kintsugi Health OS

Become the primary investigator of your own health.

Investigation, not diagnosis.

Privacy-first & patient-owned

Deterministic + guardrailed

Live demo, fully built

THE PROBLEM

Your health data is fragmented, episodic, and owned by everyone but you.

10-minute medicine

Symptoms surface between rushed appointments. No single doctor sees the whole picture.

Scattered records

Lab PDFs in email and three portals; no longitudinal view across years or sources.

Anxiety, amplified

Most trackers pile on numbers and alerts — fueling midnight symptom-googling, not clarity.

Embarrassing to raise

Sexual, mental, and reproductive health are hard to articulate in a 10-minute visit.

THE INSIGHT

Kintsugi (金継ぎ): mend what's broken with gold.

The Japanese art of repairing pottery with gold treats the cracks as part of the story — not something to hide. Your health is the same: the dips, the unexplained symptoms, the scattered results are the **evidence** that explains how you got here.

Kintsugi turns a fragmented history into something whole, legible, and yours.

THE SOLUTION

A calm, patient-owned operating system for understanding yourself.

Observe

A sub-90-second daily check-in plus timeline and memory build a longitudinal record.

Investigate

A deterministic Detective surfaces trends & correlations as questions — never verdicts.

Prepare

Turn evidence into a doctor-ready case so 10 minutes with a specialist actually count.

Modular **Investigation Packs** unify sleep, sexual & women's health, labs, longevity and more — all behind a safety guardrail layer.

HOW IT WORKS

The investigation loop

1

Capture

Check-in, timeline, vault, labs & wearables via a vendor-neutral metric layer.

2

Investigate

Detective + experiments find patterns, correlations & regime changes — explainably.

3

Understand

Health Momentum, knowledge graph, and the AI Historian make it make sense.

4

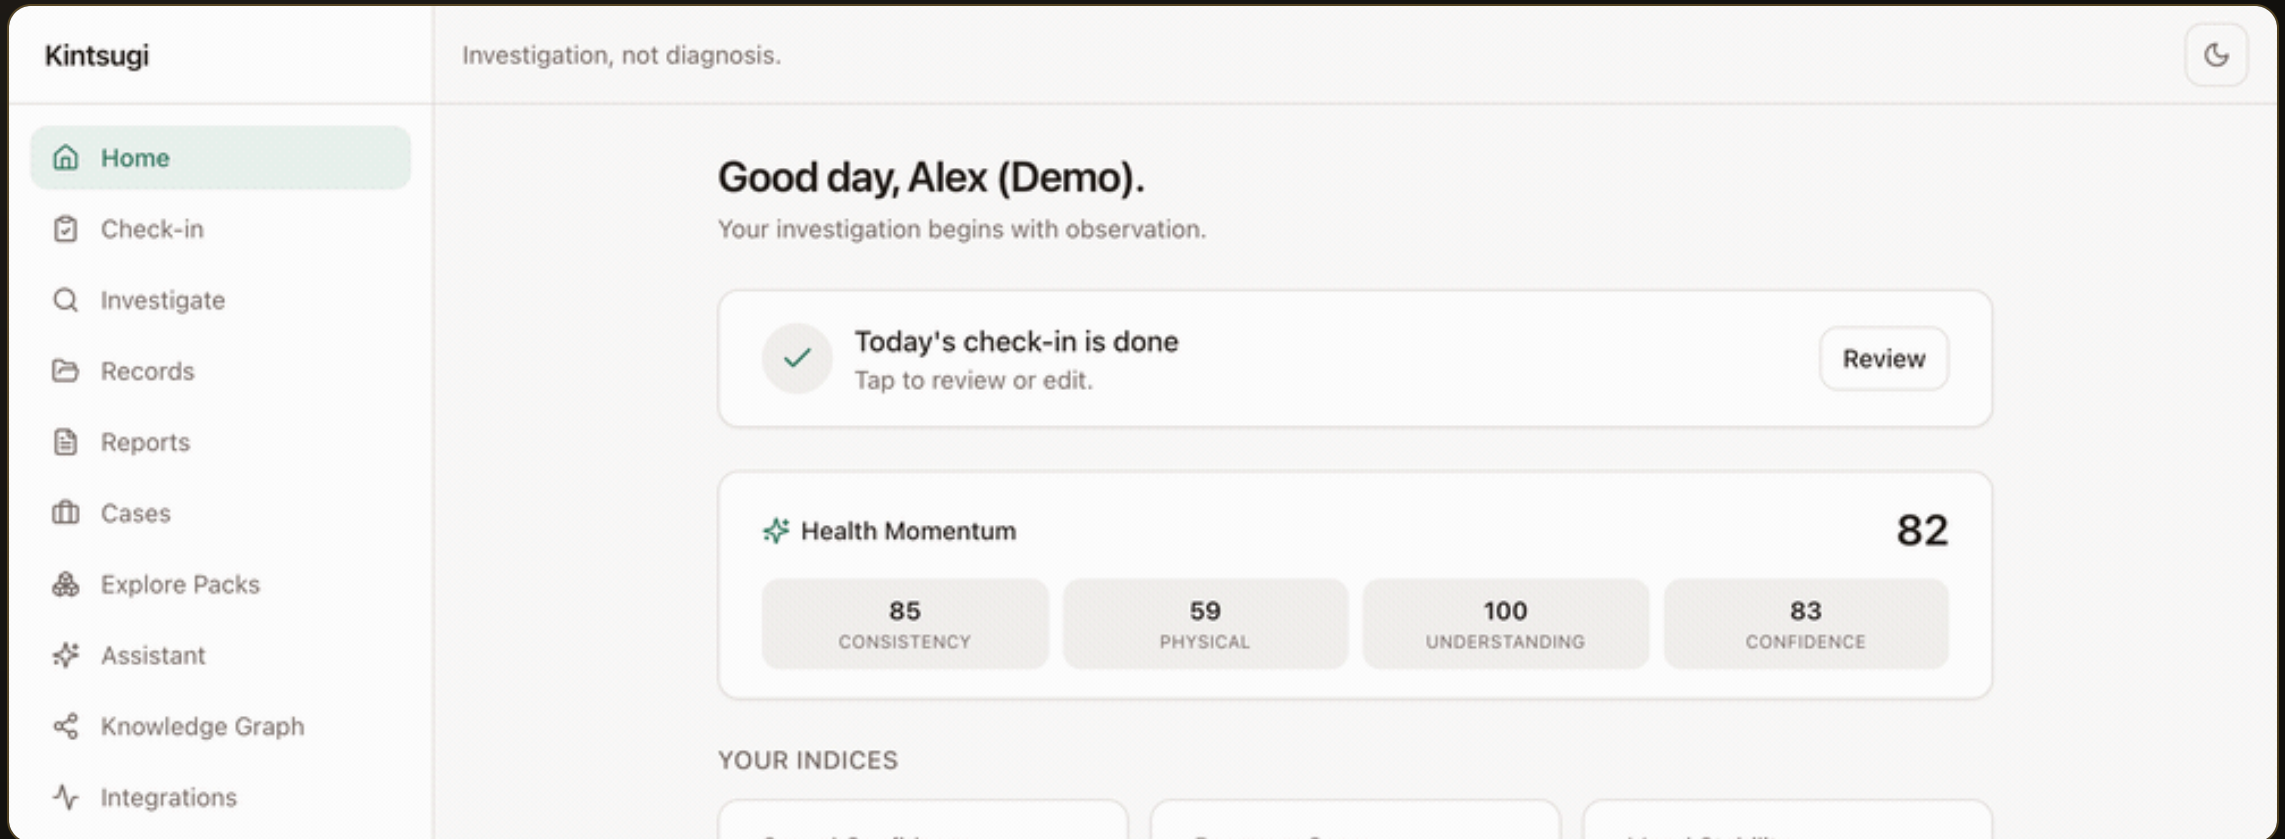

Prepare

Multi-cadence reports & a specialist-tailored case to bring to the appointment.

The product compounds: the longer you use it, the more valuable it becomes.

PRODUCT AT A GLANCE

Built, deployed, and explorable today.

WHY WE WIN

Different on the axes that build trust.

	TYPICAL TRACKING / HEALTH APPS	KINTSUGI HEALTH OS
Framing	Scores, streaks, alerts	Investigation — patterns as questions
Trust	Black-box AI that can hallucinate	Deterministic analysis + guardrail layer
Tone	Often anxiety-amplifying	Anti-anxiety by design
Ownership	Vendor-locked / data sold	Patient-owned : export + delete, always
Scope	One domain	Modular packs across many domains
Output	A dashboard to stare at	A doctor-ready case

WHO IT'S FOR

One architecture, five investigators.

The Founder Investigator

Sexual health & sleep, tracked without shame;
a urologist-ready case.

The Unexplained-Symptoms Seeker

Reconstruct years of symptoms; see what
correlates with fatigue.

The Anxious Tracker

A calm, non-alarmist read — findings as
questions to investigate.

The Women's-Health Investigator

PCOS, fertility & menopause with extra
protection for sensitive data.

The Longevity Optimizer

Rigorous N-of-1 experiments across
wearables, labs & lifestyle.

The wedge

Win the high-intent, under-served investigator
— then expand by pack.

WHY NOW

Abundant personal health data — no calm place to make sense of it.

- Wearables & at-home labs made longitudinal personal data **abundant**.
- Capable open / on-device models make **private, low-cost** intelligence feasible.
- Trust in data-harvesting health apps is **eroding** — privacy is now a feature, not a footnote.
- Yet there is still **no patient-owned synthesis layer** that stops short of diagnosis.

user-owned & exportable

BUSINESS MODEL

The user is the customer — never the product.

Free, forever

Core OS, basic Detective, weekly reports — and export & delete are **never** paywalled.

Premium ~\$12–20/mo

All packs, full AI suite, wearable sync, monthly→annual reports, larger vault.

Pack marketplace

Specialized & community packs (rev-share) — each passes a safety review gate.

Later, opt-in **clinician-prep B2B2C**: clinics sponsor premium; the patient stays the data owner. No data sale. No health-targeted ads. Ever.

A moat that compounds with trust and time.

Longitudinal data, owned by the user

Switching cost grows with every check-in; the record only gets richer.

Pack SDK ecosystem

A safety-gated marketplace turns new domains into a contributor network, not a roadmap bottleneck.

Trust & safety as product

Deterministic + guardrailed analysis is hard to copy without rebuilding the philosophy.

Brand

"Investigation, not diagnosis" owns a calm, credible category position in a noisy market.

STATUS & ROADMAP

Not a concept — a working product.

- **Shipped:** MVP (M0–M6) + Phase 2 (intelligence & integrations) + Phase 3 (marketplace & scale).
- **Live demo** with 12 weeks of synthetic data; validated architecture (verdict: GO).
- **Next:** turn on Premium & integrations with an early cohort; open the pack marketplace.
- **Then:** explore consent-gated clinician-prep partnerships.
